

iPad & Mac: the lanes become a desk.

Same app, same SwiftUI target, same three verbs. On large screens the navigation stack unfolds into a split view — library beside stems, nothing modal — and the stem stack gains a fixed header column, DAW-style. No new features: just room.

01 — ADAPTIVE STRATEGY

One layout system, three breakpoints.

COMPACT — iPHONE

Stack

NavigationStack, one screen at a time, lane controls inline in each lane header. As designed in v2.

REGULAR — iPAD

Split

NavigationSplitView: library sidebar + stem desk. Sidebar collapses for a full-width desk. Touch-first with full pointer/Pencil support; Recorder stays a sheet.

LARGE — MAC

Desk

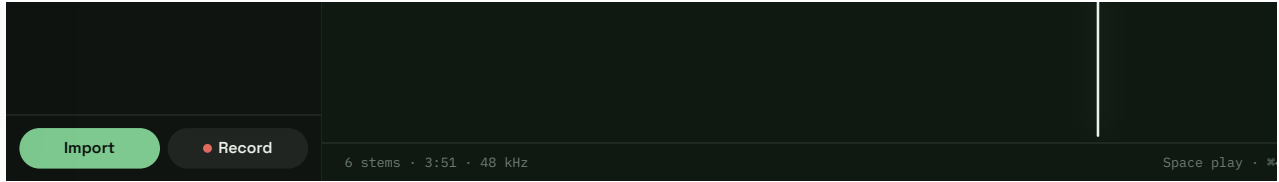

Same split view in a resizable window + menu bar, full keyboard map, multi-window (one song per window), drag stems out to Finder.

The one structural change: on regular/large widths each lane splits into a **fixed header column** (name, volume, M/S) on the left and the wave canvas on the right. Headers never scroll horizontally; waves share one viewport as on iPhone. The playhead needle stays fixed at the center of the *wave area* — the scroll-the-wave physics is identical on every device.

02 — MACOS

The Stem Desk.

Persistent library.

The sidebar is the Library — always visible, ⌘1 toggles. Selecting a song swaps the desk instantly; unseparated songs show a "Separate" button in the desk instead of lanes. Sidebar rows show sync/progress state inline.

Keyboard-first.

Space play/pause; ←/→ nudge 1s (⌘ = 15s); ⇧ drag or scroll to zoom; 1–9 solo lane N, ⌘1–9 mute; T trims selected lane; ⌘E export. All in the menu bar (File, Edit, Playback, Stems, Window) so shortcuts are discoverable.

Drag out, drop in.

Drag a lane header to Finder/Logic → exports that stem file. Drop any audio file on the window → import (+ optional auto-separate). Multi-window: ⌘N opens another song for A/B referencing.

03 — iPad (landscape, regular width)

Same desk, touch-first.

Touch stays primary.

44pt M/S buttons, 62pt play, fat volume knobs. Drag any wave to scrub all lanes; two-finger pinch zooms; swipe from left edge reveals the sidebar when collapsed. Long-press lane → same context menu as iPhone (Trim, Export, Rename).

Pencil & pointer.

Pencil hover shows a timecode ghost over the wave; pointer users get the full Mac keyboard map when a hardware keyboard is attached (same shortcuts, shown in the iPad shortcut HUD via ⌘-hold).

Portrait & Split View.

Portrait or narrow Split View drops back to the compact (iPhone) layout automatically — same code path, no special casing. Drag-and-drop stems between SoundView and other iPad apps (Files, GarageBand).

One target, size classes do the work.

```
// Root switches on horizontal size class
NavigationSplitView {           // regular+
    LibrarySidebar()
} detail: {
    StemDeskView()              // header col + lanes
}
// compact → NavigationStack (v2 as-is)

// StemLaneView gains a layout mode:
enum LaneLayout { inline       // iPhone: controls in header row
                 desk }       // iPad/Mac: fixed header column

// New/changed files:
Features/Library/LibrarySidebar.swift
Features/Stems/StemDeskView.swift
Features/Stems/LaneHeaderColumn.swift
Support/KeyboardShortcuts.swift // .keyboardShortcut map
Support/MenuCommands.swift      // macOS menu bar (Commands)
```

Shared everything. ViewModels, services, SharedViewport, and the wave Canvas are untouched — only view composition changes per size class. The playhead offset (center of wave area, not window) is computed from the header-column width.

macOS niceties. Menu bar via **Commands**, window restoration per song, Touch Bar-free, Settings scene for storage location display (“SoundView in iCloud Drive” — still no paths). Export uses NSSavePanel; drag-out uses NSItemProvider file promises (same API drives iPad drag-and-drop).

Testing additions. Snapshot matrix gains iPad landscape/portrait + Mac at min/max window sizes; keyboard-map UI tests; sidebar collapse state restoration; drag-out file-promise integration test.

Next step. Review both desks. Worth deciding: should the Mac sidebar also list the stems of the open song (jump/reorder), and does iPad need the Recorder as a slide-over instead of a sheet so you can record while seeing the library?
